Avelisse Dictation App - Meeting Notes

Call prep and outcomes for [[clients/kelly/dictation-app/overview|Avelisse Dictation App]]. Newest entry at the bottom.

2026-09-01, 10:00 GMT - Presentation: last two weeks, Android + iOS only

A walkthrough of the last two weeks of work, what's been seen, and what I thinks. Scoped to the dictation app only - Android and iOS.

Open with this question

- "Did you get a chance to try the Android version? What did you think?"

1. Android - what I got done

- Every screen now matches the final look you approved - colors, layout, the whole visual identity.
- Found and fixed a crash that happened on certain phones. The app was trying to use a shortcut some phone chips don't support - traced it to the exact phone model and fixed it properly.
- Found and fixed a bug where tapping stop quickly, or twice in a row, could get the app stuck instead of finishing the transcription. Can't happen anymore.
- Found and fixed a real privacy issue before it ever reached you: the released version was quietly saving a copy of everything dictated to a file on the phone. That directly contradicted the "private, nothing leaves the device" promise from day one. Caught it, fixed it, verified it's gone from the version people actually use.
- Fixed the keyboard defaulting to a French layout instead of the standard one.
- Went through the entire app and stripped out every trace of the original open-source project it was built on - name, look, internal references, all of it. It's fully yours now, not a reskin.
- Checked every piece of code and every third-party component this is built on for legal safety, so it's clear to sell and distribute under your name.

Everything checked out clean.
- First testable version went out to you on August 25th.

2. iOS - what I got done, and the one real blocker

- Same legal and safety check done there too. One small loose end I'm still confirming: the rights on a couple of sound effect files used in the app.
- All the internal documentation rewritten to describe your app, not the original project.
- Your final color scheme is fully applied on iOS as well.
- As of this morning, finished switching the app's internal identity over to yours too - the same kind of cleanup already done on Android.
- **The blocker:** none of that has actually been turned on yet, because the tools that build and finalize an iPhone app only run on Apple's own computers, and I don't have one. Everything above is ready and waiting - the moment that's solved, iOS can move fast, since the groundwork is already in place. Not new - it's the reason Android went first - but it's the one thing standing in the way now.

3. What's left before each is truly finished

- **Android:** the technical paperwork Google requires to publish under your name, then a short test pass, then it's ready for the Play Store.
- **iOS:** just the no-Mac problem. Nothing else moves until that's solved.

4. What I need from you

- Your test results on the Android version.
- Final brand name and logo sign-off - still sitting on a placeholder name.
- Confirmation that I actually have access to your Google Play Developer and Apple Developer accounts.
- A decision on the iOS building problem: rent access to a Mac in the cloud, use an automated cloud build service, use your own Mac when you're settled somewhere with power and internet, or buy a low-cost one outright. Your call.

Outcome

Not yet held - fill in after the call: what she said about the Android alpha, which iOS option she picked, and anything that changes

the project's status or its decisions.
